

Create a function to find, Palindrome, Fibo and Factorials

PROGRAM:

PALINDROME:

Program to check if a string is palindrome or not

```
my_str = 'aIbohPhoBiA'
```

make it suitable for caseless comparison

```
my_str = my_str.casefold()
```

reverse the string

```
rev_str = reversed(my_str)
```

check if the string is equal to its reverse

```
if list(my_str) == list(rev_str):
```

```
    print("The string is a palindrome.")
```

```
else:
```

```
    print("The string is not a palindrome.")
```

FIBO:

Program to display the Fibonacci sequence up to n-th term

```
nterms = int(input("How many terms? "))
```

first two terms

```
n1, n2 = 0, 1
```

```
count = 0
```

check if the number of terms is valid

```
if nterms <= 0:
```

```
    print("Please enter a positive integer")
```

if there is only one term, return n1

```
elif nterms == 1:
```

```
    print("Fibonacci sequence upto",nterms,":")
```

```
    print(n1)
```

generate fibonacci sequence

```
else:
```

```
    print("Fibonacci sequence:")
```

```
    while count < nterms:
```

```
        print(n1)
```

```
nth = n1 + n2
# update values
n1 = n2
n2 = nth
count += 1
```

FACT:

```
# Python program to find the factorial of a number provided by the user.
```

```
# change the value for a different result
num = 7
```

```
# To take input from the user
#num = int(input("Enter a number: "))
```

```
factorial = 1
```

```
# check if the number is negative, positive or zero
```

```
if num < 0:
```

```
    print("Sorry, factorial does not exist for negative numbers")
```

```
elif num == 0:
```

```
    print("The factorial of 0 is 1")
```

```
else:
```

```
    for i in range(1,num + 1):
```

```
        factorial = factorial*i
```

```
    print("The factorial of",num,"is",factorial)
```
